Hypertension: pms-LOSARTAN (losartan potassium) is indicated for the treatment of essential hypertension. pms-LOSARTAN is also indicated in patients with essential hypertension and left ventricular hypertrophy. pms-LOSARTAN may be used alone or concomitantly with thiazide diuretics. A great majority of patients with severe hypertension in controlled clinical trials required combination therapy. pms-LOSARTAN has been used concomitantly with beta-blockers and calcium channel blockers, but the data on such use are limited.

Type 2 Diabetic Patients with Proteinuria and Hypertension: pms-LOSARTAN is also indicated to delay the progression of renal disease as measured by the occurrence of doubling of serum creatinine, and end stage renal disease, and to reduce proteinuria.

Geriatrics (≥65 years of age): In clinical studies, there was no age-related difference in the efficacy or safety profile of losartan.

Pediatrics (6-16 years of age): Antihypertensive effects of losartan potassium have been demonstrated in hypertensive pediatric patients aged 6 to 16 years. Use of losartan potassium in these age groups is supported by evidence from adequate and well-controlled studies of losartan potassium in pediatric patients.

The Product Monograph is also available through our Medical Information department. Call us at 1-888-550-6060.
